1 Document Purpose

This document is an outline of the scope and functionality of the Elm Living PBI Tool and acts as a reference for the visuals and features of the tool.

The document has been created to ensure alignment of the tool between JMAN and Elm Living. It will also be used during the project as a reference point on the requirements.

2 Project Background and Scope

2.1 Context and Background

Elm Living is a boutique retailer selling unique furniture and decor items. They sell their products to small businesses as well as individuals.

If an item is not available in store when a purchase is made, an order is placed, hence the time between product purchase and delivery can vary. Each store records when the purchase was made and when it was delivered.

Some products are then returned. Elm Living excludes returns from their revenue figures to get an accurate picture of income.

Over the past two years, Elm Living have started selling a wider variety of products and have made a couple of strategic decisions by using promotions and selling their products online. They are interested in understanding how the Covid-19 pandemic has impacted their sales.

They currently use Excel graphs and charts to analyse sales information on an ad hoc basis for each store. The management team of Elm Living would like one tool which analyses sales information across all stores and products.

The reports will be presented in Tableau dashboards and will include the ability to filter certain fields and drill into specific areas.

2.2 Tool Objectives

The Tool is being created to improve the visibility on company performance. This involves:

1. Understanding how each store is performing compared to the overall business and against other stores
2. Understanding which of the 24 products are performing well, both in store and online
3. Additionally, they would like to gain some insight into deliveries, returns and promotions

2.3 Graphic and Colour Scheme Requirements

The client has some specific requirements regarding the look and design of this tool. They would like:

1. A user-friendly homepage whereby users can see information about each page of the tool and jump to and from any of the report pages
2. All pages of the tool should feature:
 - a. The company logo
 - b. Buttons and filters of the same colour scheme as their logo, which is based on the (70, 40, 240) RGB colour code
 - c. Graphs, charts, and tables should use shades of blue, purple, pink, and grey in line with the company's colour scheme
 - d. Any useful information for users on how to use the tool
3. All other design elements are left to JMAN to determine

3 Functional Requirements

3.1 Monthly Orders Overview

Visuals:

- Line/Area chart: **Total Orders per Month**
- Metrics:
 - Month-over-Month Delta
 - Same Month Last Year Delta

Filters:

- Age Group (15–19, 20–24, 25–30...)
- Gender
- Store
- Product / Product Category
- Sales Channel (In-store vs Online → Derived from *Orders table* vs *Online Orders table*)

3.2 Revenue vs. Store Running Cost

- Create a dual-line chart (or area chart) to show:
 - Year-to-date (YTD) Revenue
 - Year-to-date Store Running Cost
- Allow users to filter by:
 - Store
 - In-store vs. Online Sales

3.3 Revenue Growth Table

- Develop a text table (or highlight table) showing:
 - Revenue per Product
 - % Increase/Decrease vs. Previous Year
- Apply conditional formatting:
 - Increase → Green
 - Decrease → Red
 - No Change → Gray/Neutral
 - Filterable by Store.

3.4 Returns and Promotions

Product Return Analysis

- Create a bar chart or heat map that shows which products are returned most frequently.
- Users can drill down by Store or Product Category.

3.5 Promotional Sales Contribution

- Visualize the percentage of total sales from promotional activity.
- Filterable by:
 - Month
 - Store
 - Promotion Type

3.6 Delivery Performance

- Create a KPI visual showing the average number of days from purchase to delivery.
- Add a Top 5 products and Top 5 stores table for the longest delivery times.

4. Technical Requirements

The Tableau dashboard must include at least one example of each:

Requirement	Description	How it will be implemented in this project
1. Switch Measure	Use a parameter to switch metrics	Monthly Orders Dashboard → switch between Orders / Revenue / Profit
2. Parameter	Parameter controlling filter view or metric	Product vs Category switch
3. Measures using Variables (LET)	Use Tableau variables for delta calculations	MoM calculation & YoY calculation
4. Dynamic Text Value	Dynamic headings/titles responding to filters	Example: "Revenue Trend for <Selected Store>"
5. Actions (REQUIRED)	Use dashboard actions to improve navigation	Added below (Actions section)

4.1 Dashboard Actions

Filter Action

- From Product Return Chart → Product Delivery Table
- Users click a product to view its delivery performance.

Highlight Action

- Used in Monthly Orders chart: highlight selected month while keeping others visible.

5 Data Overview

From our initial investigation into the data available across the organisation, we have been able to extract the data into an excel file. Descriptions of each tab have been outlined below.

Please note that ELM Living have asked for all transformations and manipulation of the data to take place in Tableau , rather than in Excel, Alteryx or any other tool.

Ref	Data Sheet	Description
1	Sales	This contains the details of each purchase, units sold, and when the product was ordered and delivered.
2	Stores	This contains the store locations and cost of running the store per year.
3	Products	This contains a list of different products, the category these products fall under, and additional product details and dimensions.
4	Issues & Promotions	If there is a reported issue then the product has been returned and if there is no issue then the sale has been successful. There are two types of promotions considered: 20% coupon or a 10% store discount.
5	In Store Orders	This contains a list of orders placed in the store and includes some specific details on the customer
6	Online Orders	This contains a list of orders made online and includes some specific details on the customer
